

multicyclone centrifugal water filtration

SAVE WATER - SAVE MONEY REDUCE MAINTENANCE

Incoming water enters the multiple hydro cyclones tangentially, generating a strong centrifugal effect.

Sediment is spun out and spirals down to the sediment sump, while the filtered water flows up through the outlet.

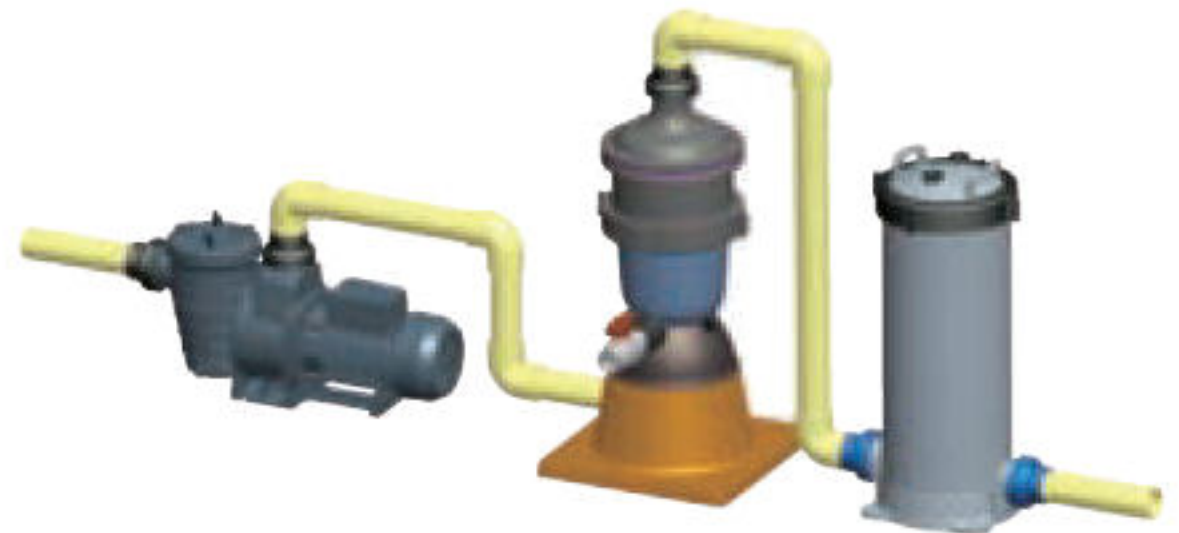

The MultiCyclone is cleaned by simply opening its valve. Only 15 litres of water is discharged to cleanse the MultiCyclone.

FEATURES

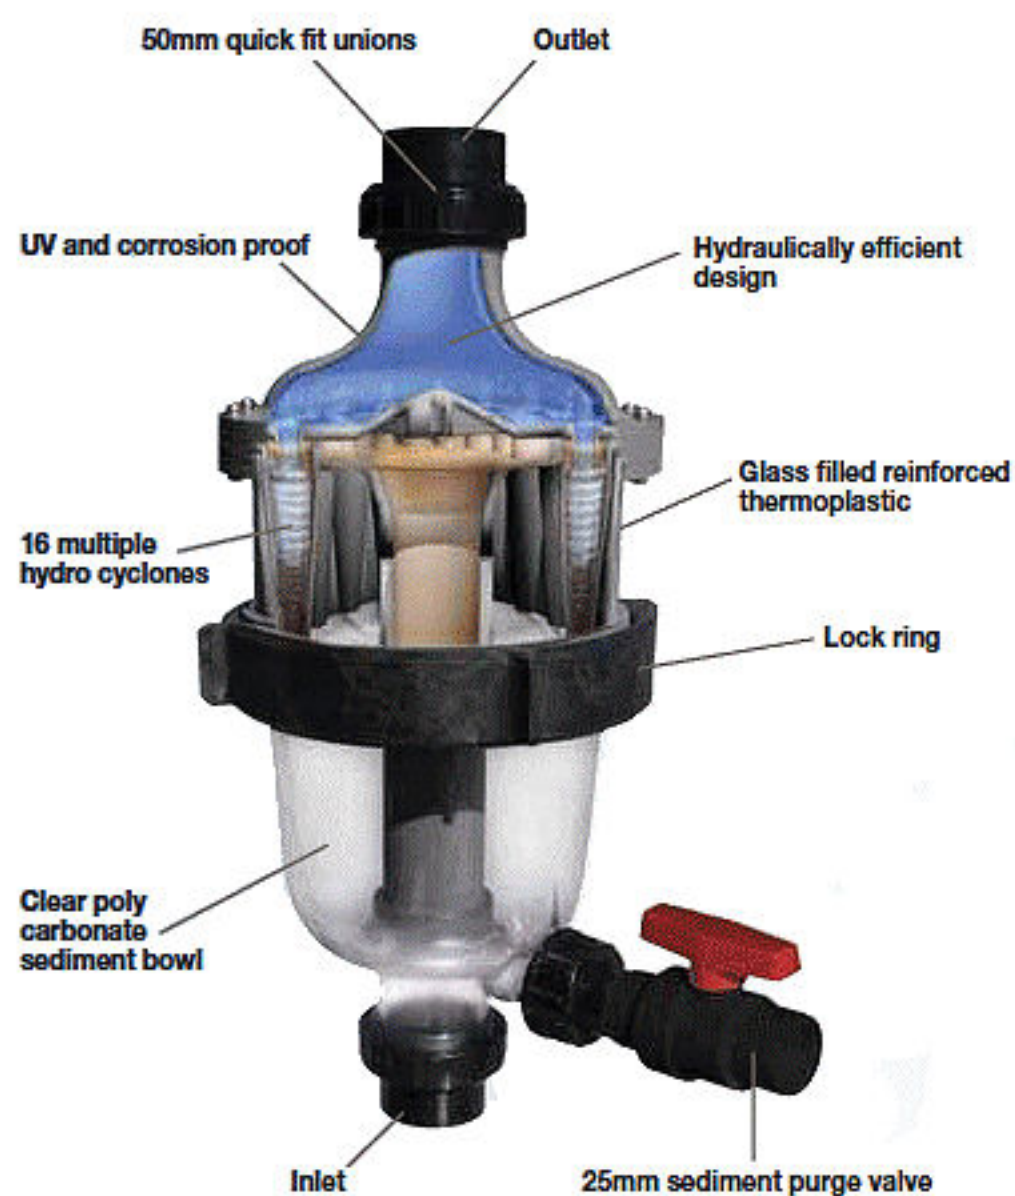

- Reduce filter cartridge maintenance
- No filter media to clean/replace
- Reduce frequency of backwashing

REDUCE FREQUENCY OF BACKWASHING

REDUCE FILTER CARTRIDGE MAINTENANCE
